ABSTRACT

This paper studies the existence and uniqueness solution of fractional integro-differential equation, by using some numerical graphs with successive approximation method of fractional integro-differential equation. The results of written new program in Mat-Lab show that the method is very interested and efficient. Also we extend the results of Butris [3].

Keywords: fractional Integro-differential equations, Successive approximations method, Mat-lab program method, Existence and Uniqueness,

1. Introduction

Fractional differential equations have been of great interest recently. It is caused both by the intensive development of theory of fractional calculus itself and by application of such constructions in various sciences such as physics, chemistry, mechanics, engineering. For details, see [4, 5, 6, 7,8]. Burris[3]has study a solution of integro-differential equation of fractional order which has the form:

\[ x^{(\alpha)}(t) = f\left(t, x, \int_{t-r}^{t} g(sx(s))ds\right), x_0 , \quad 0 < \alpha < 1 \]

where \( x \in D_\alpha \subseteq [0,T] \) and \( D_\alpha \) is a closed and bounded domain.

This paper use some numerical graphs with successive approximation method of fractional integro-differential equation and also extend the results of Butris [3],where \( D^\alpha \) is the standard Riemann – Liouville fractional derivative.

Definition

Let \( f \) be a function which is defined a. e. (almost everywhere) on \([a,b]\). For \( \alpha > 0 \), we define:

\[ I^\alpha_a f = \frac{1}{\Gamma(\alpha)} \int_a^b (b-s)^{\alpha-1} f(s)ds \]

Provided that this integral (Lebesgue) exists.

Definition 2.[2]. If \( \alpha > 0 \), then Gamma's function is denote by \( (\Gamma) \) and defined by the form:

\[ \Gamma(\alpha) = \int_0^\infty e^{-s} s^{\alpha-1} ds \]

Lemma 1[1].

If \( \{f_n\}_{n=1}^\infty \) is a sequences of functions is defined on the set \( E \subseteq R \) such that \( |f_n| \leq M_n \), where \( M_n \) is a positive number, then \( \sum_{n=1}^\infty f_n \) is
uniformaly convergent on E if \( \sum_{n=1}^{\infty} M_n \) is convergent.

**Lemma 2[1].**

Let \( E_\alpha(m, x) = \sum_{n=1}^{\infty} \frac{m^{\alpha-1} x^{\alpha n-1}}{\Gamma(n \alpha)} \), where \( m = R \), then:

- the series converges for \( x \neq 0 \) and \( \alpha > 0 \).
- the series converges everywhere when \( \alpha \geq 0 \).
- if \( \alpha = 0 \), then \( E_1(m, x) = \exp(mx) \).

**Lemma 3[3].**

If \( K_1 \) and \( K_2 \) be a positive constant, and \( f \) be a continuous function on \( a \leq t \leq b \), such that:

\[
f(t) \leq K_1 + K_2 \int_a^t f(s)ds
\]

Then

\[
f(t) \leq K_1 \exp(K_2(t-a))
\]

This paper deals some numerical graphs with successive approximation method of fractional integro-differential equation which has the form:

\[
x^{(a)}(t) = f(t, x(t), h(t)x(t), \int_{t-T}^{t} P(s, x(s), h(s)x(s))ds) \quad (1)
\]

where \( x \in D_\alpha \subseteq [0, T] \), \( D_\alpha \) is a closed and bounded domain subset of \( R \).

We denote to

\[
\int_{t-T}^{t} P(t, x(t), h(t)x(t))dt
\]

by

\( g(t) \).

Suppose that the functions \( f(t, x(t), h(t)x(t), g(t)) \), \( h(t) \) satisfies the following inequalities:

\[
\|f(t, x(t), h(t)x(t), g(t))\| \leq M
\]

\[
\left\|f(t, x(t), h(t)x(t), g(t)) - f(t, x(t), h(t)x(t), g(t))\right\| \leq \frac{L}{\Gamma(1+\alpha)} \|x\|^{\alpha-1}
\]

\[
\left\|f(t, x(t), h(t)x(t), g(t))\right\| \leq N \quad (4)
\]

for all \( t \in [0, T] \), and \( x, x_1, x_2 \in D_\alpha \), where \( L, M, N, K \), are positive constants, \( \|\| = \max \|\| \).

\[
\|h(t)\| \leq N, N > 0 \quad (5)
\]

We define the non-empty sets as follows:

\[
D_{\alpha f} = D_\alpha - \frac{T^\alpha}{\Gamma(\alpha+1)} M, \quad D_{\alpha f} \neq \varnothing
\]

Moreover, we suppose the value of the following equation:

\[
\omega = \frac{T^\alpha}{\Gamma(\alpha+1)} \eta < 1 \quad (7)
\]

2. **Existence of Solution**

**Theorem 1.**

Let the vector function \( f(t, x(t), h(t)x(t), Q(t)) \) be defined in the domain (2), continuous in \( t, x \) and satisfy the inequalities (3),(4), and (5) , then the function:

\[
x(t, x_0) = x_0 + \frac{1}{\Gamma(\alpha)} \int_{t-T}^{t} \int_{t-T}^{t} P(t, x(s), h(s)x(s)ds) ds
\]

is a solution of (1).

**Proof:**

Let

\[
x_0^{(\alpha-1)}(t, x_0) = x_0 \quad m = 0, 1, 2, ...
\]

be a sequence of functions which is defined on the domain:
\((t,x_0) \in [0,T] \times D_{af}\)

(9)

We will divide the proof as follows:

(i) \(x_m(t,x_0) \in D_{af}, \text{ for all } t \in [0,T], x_0 \in D_{af}\).

(ii) \(x_m(t,x_0) \in D_{af}, \text{ is uniformly convergent to the function } x(t,x_0) \text{ on the domain}(9) , \text{ for all } t \in [0,T], x_0 \in D_{af}\).

(iii) \(x(t,x_0) \in D_{af}, \text{ for all } t \in [0,T], x_0 \in D_{af}\).

proof (i):

Set \(m=0\) and use (8), we get:

\[
\|x_i(t,x_0) - x_0\| = \left\| x_0 + \frac{1}{\Gamma(\alpha)} \int_0^t \left( f(s, x_i(s,x_0), h(s)x_i(s,x_0), \int_{s,T} P(t, x_i(t,x_0), h(t)x_i(t,x_0))dt\right) (t-s)^{\alpha-1}ds \right\|
\]

\[
\leq \frac{1}{\Gamma(\alpha)} \int_0^t \left( f(s, x_i(s,x_0), h(s)x_i(s,x_0), \int_{s,T} P(t, x_i(t,x_0), h(t)x_i(t,x_0))dt\right) (t-s)^{\alpha-1}ds
\]

\[
\leq \frac{1}{\Gamma(\alpha)} \int_0^t M(t-s)^{\alpha-1}ds
\]

\[
\leq \frac{t^\alpha}{\Gamma(\alpha + 1)} M , \text{ for } t \in [0,T]
\]

\[
\|x_i(t,x_0) - x_0\| \leq \frac{T^\alpha}{\Gamma(\alpha + 1)} M
\]

(10)

That is \(x_i(t,x_0) \in D_{af}, \text{ for all } t \in [0,T], x_0 \in D_{af}\).

By mathematical induction we have:

\[
\|x_m(t,x_0) - x_0\| = \left\| x_0 + \frac{1}{\Gamma(\alpha)} \int_0^t \left( f(s, x_m(s,x_0), h(s)x_m(s,x_0), \int_{s,T} P(t, x_m(t,x_0), h(t)x_m(t,x_0))dt\right) (t-s)^{\alpha-1}ds \right\|
\]

\[
\leq \frac{1}{\Gamma(\alpha)} \int_0^t \left( f(s, x_m(s,x_0), h(s)x_m(s,x_0), \int_{s,T} P(t, x_m(t,x_0), h(t)x_m(t,x_0))dt\right) (t-s)^{\alpha-1}ds
\]

\[
\leq \frac{1}{\Gamma(\alpha)} \int_0^t M(t-s)^{\alpha-1}ds
\]

\[
\leq \frac{T^\alpha}{\Gamma(\alpha + 1)} M
\]

where \(x_0 \in D_{af}, \ t \in [0,T], \text{ for all } x_m(t,x_0) \in D_{af}\)

proof (ii):

Now, we shall prove that the sequence of functions (9) is uniformly convergent on (9). From (8), when \(m=1\) we get:

\[
\|x_1(t,x_0) - x_0\| = \left\| x_0 + \frac{1}{\Gamma(\alpha)} \int_0^t \left( f(s, x_1(s,x_0), h(s)x_1(s,x_0), \int_{s,T} P(t, x_1(t,x_0), h(t)x_1(t,x_0))dt\right) (t-s)^{\alpha-1}ds \right\|
\]

\[
\leq \frac{1}{\Gamma(\alpha)} \int_0^t \left( f(s, x_1(s,x_0), h(s)x_1(s,x_0), \int_{s,T} P(t, x_1(t,x_0), h(t)x_1(t,x_0))dt\right) (t-s)^{\alpha-1}ds
\]

\[
\leq \frac{1}{\Gamma(\alpha)} \int_0^t M(t-s)^{\alpha-1}ds
\]

\[
\leq \frac{T^\alpha}{\Gamma(\alpha + 1)} M
\]

and hence

\[
\|x_2(t,x_0) - x_1(t,x_0)\| \leq \omega^2 M
\]

Now when \(m=2\) in (8) we get:

\[
\|x_2(t,x_0) - x_1(t,x_0)\| = \left\| x_1(t,x_0) + \frac{1}{\Gamma(\alpha)} \int_0^t \left( f(s, x_2(s,x_0), h(s)x_2(s,x_0), \int_{s,T} P(t, x_2(t,x_0), h(t)x_2(t,x_0))dt\right) (t-s)^{\alpha-1}ds \right\|
\]

\[
\leq \frac{1}{\Gamma(\alpha)} \int_0^t \left( f(s, x_2(s,x_0), h(s)x_2(s,x_0), \int_{s,T} P(t, x_2(t,x_0), h(t)x_2(t,x_0))dt\right) (t-s)^{\alpha-1}ds
\]

\[
\leq \frac{T^\alpha}{\Gamma(\alpha + 1)} M
\]

\[
\|x_3(t,x_0) - x_2(t,x_0)\| \leq \omega^3 M
\]

doi : 10.25007/ajnu.v8n4a431
\[ \leq \frac{1}{\Gamma(a)} \left( 1 + N \right) \int_0^1 \left( \frac{T^a}{\Gamma(a+1)} \right)^2 M (t-s)^{a-1} ds \]

\[ \leq \frac{1}{\Gamma(a)} \left( 1 + N \right) \int_0^1 \left( \frac{T^a}{\Gamma(a+1)} \right)^2 M (t-s)^{a-1} ds \]

\[ \leq \eta^2 \omega^3 M \]

Therefore

\[ \| x_3(t, x_0) - x_2(t, x_0) \| \leq \eta^2 \omega^3 M \]

Then by mathematical induction we have:

\[ \| x_{m+1}(t, x_0) - x_m(t, x_0) \| \leq \eta^m \omega^{m+1} M \]

(11)

For all \( m = 0, 1, 2, \ldots \).

Now from (11), and for \( p \geq 1 \), we get:

\[ \| x_{m+p}(t, x_0) - x_m(t, x_0) \| \leq M \sum_{j=0}^{p-1} \omega^{j+1} \eta^j \]

(12)

WHERE

\[ \| x_{m+p}(t, x_0) - x_m(t, x_0) \| = \]

\[ \| x_{m+p}(t, x_0) - x_{m+p-1}(t, x_0) \| + \]

\[ + \| x_{m+p-1}(t, x_0) - x_{m+p-2}(t, x_0) \| + \cdots + \]

\[ + \| x_{m+1}(t, x_0) - x_m(t, x_0) \| ] \]

\[ \leq \left( \frac{T^a}{\Gamma(a+1)} \right)^{m-p} \| x_{m+p}(t, x_0) - x_{m+p-2}(t, x_0) \| + \]

\[ + \left( \frac{T^a}{\Gamma(a+1)} \right)^{m-p} \| x_{m+p-1}(t, x_0) - x_{m+p-2}(t, x_0) \| + \]

\[ + \cdots + \left( \frac{T^a}{\Gamma(a+1)} \right)^m \| x_{m+1}(t, x_0) - x_m(t, x_0) \| \]

SO THAT

\[ \left\| x_{m+p}(t, x_0) - x_{m}(t, x_0) \right\| \leq \left( \frac{T^a}{\Gamma(a+1)} \right)^{m} \left( \eta^2 \omega^3 \right) M \]

(13)

We note that the right hand side from (13) is bounded with the convergent geometric series and its summation to equals \( \frac{1}{1-\Psi} \) and hence

\[ \left\| x_{m+p}(t, x_0) - x_{m}(t, x_0) \right\| \]

\[ \leq \left( \frac{T^a}{\Gamma(a+1)} \right)^{m} \left( 1 - \left( \frac{T^a}{\Gamma(a+1)} \right)^{m} \right) M \eta \]

(14)

But the inequality (7) is less than unity, then

\[ \lim_{m \to \infty} \left( \frac{T^a}{\Gamma(a+1)} \right)^{m} = 0 \]

(15)

Thus the right hand side of (14) equals to zero when \( m \to \infty \). Suppose that \( E > 0 \), we get a positive integer \( n \) such that \( n < m \), and satisfied the next estimation for all \( m \):

\[ \left\| x_{m+p}(t, x_0) - x_{m}(t, x_0) \right\| < E, \ p \geq 0. \]

Then according to the definition of uniformly convergent [1], we find that the sequence of function \( \{ x_{m}(t, x_0) \}_{m=0}^{\infty} \) is uniformly convergent to the function \( x(t, x_0) \) and this function is continuous on the same interval.

Putting:

\[ \lim_{m \to \infty} x_m(t, x_0) = x(t, x_0) \]

(16)

proof (iii):
to prove $x(t,x_0) \in D_\alpha$, for all $t \in [0,T]$, $x_0 \in D_{\alpha f}$ we assume that:

$$
\left| \frac{1}{\Gamma(\alpha)} \int_0^t \left( \frac{1}{s(x(s),h(s)x(s),s)} \right) \left( \frac{1}{I_T^\alpha (t-s)^{-\beta}} \right) ds - \frac{1}{\Gamma(\alpha)} \int_{\alpha}^t \left( \frac{1}{s(x(s),h(s)x(s),s)} \right) \left( \frac{1}{I_T^\alpha (t-s)^{-\beta}} \right) ds \right|
$$

$$
\leq \frac{1}{\Gamma(\alpha)} \int_0^t \left( \frac{1}{s(x(s),h(s)x(s),s)} \right) \left( \frac{1}{I_T^\alpha (t-s)^{-\beta}} \right) ds
$$

Then

$$
\lim_{m \to 0} \frac{1}{\Gamma(\alpha)} \int_0^t \left( \frac{1}{s(x(s),h(s)x(s),s)} \right) \left( \frac{1}{I_T^\alpha (t-s)^{-\beta}} \right) ds
$$

Let all assumptions and conditions of theorem 1 be given then the problem (1), has a unique solution $x = x_\infty(t, x_0)$ on the domain (9).

**Proof:**

On the contrary, we suppose that there is another solution $\hat{x}(t, x_0)$ of the problem (1), which is defined by the following integral equation:

$$
\hat{x}(t, x_0) = x_0 + \frac{1}{\Gamma(\alpha)} \int_0^t \left( \frac{1}{s(x(s),h(s)x(s),s)} \right) \left( \frac{1}{I_T^\alpha (t-s)^{-\beta}} \right) ds (17)
$$

Now we shall prove that $\hat{x}(t, x_0) = x(t, x_0)$ for all $x_0 \in D_{\alpha f}$, and to do this we need to prove the following inequality:

$$
\|\hat{x}(t, x_0) - x_m(t, x_0)\| \leq \omega^m M^* \eta^m \quad (18)
$$

where $\|f(t, x(t), h(t) x(t), g(t))\| \leq M^*$,

$$
\eta = (1 + N)L.
$$

Let when $m=0$ in (8) and from (17) we find:

$$
\|\hat{x}(t, x_0) - x_m(t, x_0)\| = \|x(t, x_0) - x_m(t, x_0)\| \leq \omega^0 M^* \eta^0
$$

and when $m=1$ in (8) and from (17) we find that

$$
\|\hat{x}(t, x_0) - x_0\| = \|x(t, x_0) - x_0\| \leq \frac{T^a}{\Gamma(\alpha + 1)} M^*
$$

3. **Uniqueness of Solution**

The study of the uniqueness solution of (1), will be introduced by the following:

**Theorem 2.**
Thus we find that the inequality (18) is satisfying when 

\( m = 0, 1, 2, \ldots \).

Then by a condition (16) we get:

\[
\hat{\chi}(t, x_0) = \lim_{m \to x} m(t, x_0) = x(t, x_0)
\]

and this proves that the two solutions are congruent in

the domain \( (9) \).

### 4. Numerical Results

In this section we investigate the existence, uniqueness

solution of fractional Integro- differential equations by

using a new written program in Mat-Lab software. An

example which is corresponding to our general form

(3) , solved by using in Mat-Lab Release R2017a.

Example 4.1: First, we consider the following fractional

differential equation, for \( t \in I = [0,1] \).

\[
\mathbf{D}^\alpha u(t) = u(t) + \frac{8}{31(0.5)} t^{1.5} - t^2 - \frac{1}{3} t^3 + \int_0^t f(s) ds 
\]

\( u(0) = 0 \)

The exact solution and successive approximation

method are show in figure(1)
Example 4-2: consider the following fractional integro-differential equation, for \( t \in I = [0,1] \).

\[
D^{(\alpha)}u(t) = -\frac{t^2e^t}{5} + \frac{6t2^{2.5}}{\Gamma(2.5)} + \int_0^t e^t u(s) \, ds, \quad u(0) = 0
\]

The exact solution and successive approximation method are shown in figure (2).

Figure (1) The exact solution is compared with the successive approximate in different values of (\( \alpha \))
Example 4-3: consider the following fractional integro-differential equation, for \( t \in I = [0,1] \).

\[
\mathbf{D}^{(\alpha)} \mathbf{u}(t) = (\cos t - \sin t) + \frac{2t^{1.5}}{\Gamma(2.5)} + \frac{t^{0.5}}{\Gamma(1.5)} + t(2 - 3 \cos t - t \sin t + t^2 \cos t) + \int_{t-2\pi}^{t} s \cdot \sin s \, ds, \quad \mathbf{u}(0) = 0
\]

The successive approximation method with different value (\( \alpha \)) of are show in the figure (3).

5. Acknowledgments

I would like to express thanks and great appreciation to the prof. Dr. Raad N. Butris for his scientific orientations through his supervision of the research. I wish him a long life and a happy life.
